SIEMENS

Burner controls for the supervision of 1- or 2-stage gas or gas / oil burners of small to medium capacity, operation, with or without fan in intermittent.

The LME... and this Data Sheet are intended for use by OEMs which integrate the burner controls in their products.

Use, features LME... burner controls are used for the startup and supervision of 1- or 2-stage gas or Use gas / oil burners in intermittent operation. The flame is supervised by an ionization probe or flame detector QRA... with ancillary unit AGQ3...A27 for gas / oil forced draft burners or blue-burning flames with blue-flame detectors QRC... In terms of housing dimensions, the LME... are identical with the LGB... and LMG... burner controls (refer to «Type summary»). For gas burners with or without fan to EN 298: 2003 For gas burners with fans conforming to EN 676 For oil burners to EN 230: 2005 Features Undervoltage detection Air pressure supervision with functional check of the air pressure switch during startup and operation Electrical remote reset facility Multicolor indication of fault status and operational status messages Limitation of the number of repetitions Accurate control sequence thanks to digital signal handling Controlled intermittent operation after 24 hours of continuous operation Supplementary documentation Product Range Overview LME......Q7101

Building Technologies HVAC Products

Warning notes To avoid injury to persons, damage to property or the environment, the following warning notes must be observed! Do not to open, interfere with or modify the unit! All activities (mounting, installation and service work, etc.) must be performed by qualified staff Before making any wiring changes in the connection area, completely isolate the plant from mains supply (all-polar disconnection). Ensure that the plant cannot be inadvertently switched on again and that it is indeed dead. If not observed, there is a risk of electric shock hazard Ensure protection against electric shock hazard by providing adequate protection for the burner control's connection terminals Check the connecting lines of the air pressure switch for short-circuits (connection • terminals 3, 6 and 11) Press the lockout reset button / operation button of LME... or the AGK20... lockout • reset button extension only manually (applying a force of no more than 10 N) without using any tools or pointed objects Fall or shock can adversely affect the safety functions. Such units must not be put into operation, even if they do not exhibit any damage Each time work has been carried out (mounting, installation, service work, etc.), • check to ensure that wiring is in an orderly state and make the safety checks as described in «Commissioning notes» **Engineering notes** When used in connection with actuators, there is no position feedback signal from • the actuator to the burner control •

- When used in connection with actuators, the requirements of applicable norms and regulations must be observed
- The running times of the actuators must match the burner control's program. An additional safety check of the burner control together with the actuators is required
- When substituting burner controls type LGB... or LMG... by LME..., the AGQ1... or AGQ2... ancillary unit must be replaced by the AGQ3...A27

Mounting notes

MANIF

Ensure that the relevant national safety regulations are complied with

- Always run the high ignition cables separate from the unit and other cables while observing the greatest possible distance
- Do not mix up live and neutral conductors
- Install switches, fuses, earthing, etc., in compliance with local regulations
- The connection diagrams show the burner controls with earthed neutral conductor. In networks with non-earthed neutral conductor and ionization current supervision, terminal 2 must be connected to the earth conductor via an RC unit (type reference ARC 4 668 9066 0). It must be made certain that local regulations are complied with (e.g. protection against electric shock hazard) since AC 120 V (50 / 60 Hz) or AC 230 V (50 / 60 Hz) mains voltage produces peak leakage currents of 2.7mA
- Make certain that the maximum permissible current rating of the connection terminals will not be exceeded
- Do not feed external mains voltage to the control outputs of the unit. When testing the devices controlled by the burner control (fuel valves, etc.), the LME... must not be connected
- In the case of burners with no fan motor, an AGK25 must be connected to terminal 3 of the unit, or else the burner cannot reliably be started up
- For safety reasons, feed the neutral conductor to terminal 2. Connect the burner components (fan, ignition transformer and fuel valves) to the neutral distributor as shown below in figure. The connection between neutral conductor and terminal 2 is prewired in the base

Electrical connection of flame detectors

- It is important to achieve practically disturbance- and loss-free signal transmission:
 - Never run detector cables together with other cables
 - -Line capacitance reduces the magnitude of the flame signal
 - -Use a separate cable
 - Observe the permissible length of the detector cables (refer to «Technical data»)
 - The ionization probe is not protected against electric shock hazard
 - Locate the ignition electrode and the ionization probe such that the ignition spark cannot arc over to the ionization probe (risk of electrical overloads) and that it cannot adversely affect the supervision of ionization
 - Insulation resistance
 - Must be a minimum of 50 $\mbox{M}\Omega$ between ionization probe and ground
 - Soiled detector holders reduce the insulation resistance, thus supporting creepage currents
 - Earth the burner in compliance with the relevant regulations; earthing the boiler alone does not suffice

MN

• When commissioning the plant for the first time or when doing maintenance work, make the following safety checks:

Service notes

• Use the KF8872 service adapter for short periods of time only

| | Burner controls has a designed lifetime* of 250,000 burner startup cycles which, under normal operating conditions in heating mode, correspond to approx. 10 years of usage (starting from the production date given on the type field). This lifetime is based on the endurance tests specified in standard EN230 / EN298 and the table containing the relevant test documentation as published by the European Association of Component Manufacturers (Afecor) (<u>www.afecor.org</u>). |
|-------------------------------|--|
| | The designed lifetime is based on use of the burner controls according to the manufac- turer's Data Sheet. After reaching the designed lifetime in terms of the number of burner startup cycles, or the respective time of usage, the burner control is to be re- placed by authorized personnel. |
| Disposal notes | * The designed lifetime is not the warranty time specified in the Terms of Delivery |
| Mechanical design | The unit contains electrical and electronic components and must not be disposed of together with domestic waste. Local and currently valid legislation must be observed. |
| LME | Units of plug-in design like their predecessor types LGB and LMG (refer to «Dimensions») The housing is made of impact-proof, heat-resistant and flame-retarding plastic. It is of plug-in design and engages audibly in the base The housing accommodates the microcontroller for the control sequence and the control relays for load control electronic flame signal amplifier (ionization) lockout reset button with its integrated 3-color signal lamp (LED) for operational status and fault status messages and the socket for connecting the OCI400 interface adapter or the AGK20 lockout reset button extension |
| Indication and diagnostics | Multicolor indication for operational status and fault status messages Transmission of operational status and fault status messages and detailed service information via additional OCI400 interface adapter and ACS410 PC Windows software |
| Versions | Burner capacity unlimited (thermal output on startup ≤ 120 kW) 3 repetitions in the event of loss of flame during operation (LME11 / LME41.051) Repetition in the event of loss of flame during operation (LME41.052 / LME41.053 / LME41.054 / LME41.071 / LME41.091 / LME41.092) |

| Detector current required for reliable operation | ≥ DC 3µA | ≥ DC 3µA | |
| Switching threshold in the event of poor flame during operation | Approx. DC 5µA | Approx. DC 5µA | |
| (LED flashes green) | | | |
| Short-circuit current between ionization probe and ground (AC ammeter $Ri \le 5 k\Omega$) | Max. AC 50150µA | Max. AC 100300µA | |

1) For applications outside the European Community, operation at mains voltage AC 120 V / AC 230 V ±10% is ensured

Note

With the same quality of flame, the detector current with the LME... may be other than with the LMG... / LGB...

Flame supervision with ionization is accomplished by making use of the conductivity and rectifying effect of the flame. The flame signal amplifier only responds to the DC current component of the flame signal. A short-circuit between ionization probe and ground causes the burner to initiate lockout.

Resetting the burner control

of mains failure.

Limitation of repetitions (only LME11..., LME41.051...) When lockout occurs, the burner control can immediately be reset. To do this, press the lockout reset button for about 1 second (< 3 seconds). The LME... can only be reset when all contacts in the line are closed and when there is no undervoltage.

If no flame is established at the end of «TSA», or if the flame is lost during operation, a maximum of 3 repetitions per controlled startup can be performed via «R», or else lockout will be initiated. Counting of repetitions is restarted each time a controlled startup via «R» takes place.

Operation

Lockout reset button «EK» is the key operating element for resetting the burner control and for activating / deactivating the diagnostics functions.

The multicolor signal lamp (LED) in the lockout reset button is the key indicating element for visual diagnostics and interface diagnostics.

Both «EK» and LED are located under the transparent cover of the lockout reset button.

There are 2 diagnostics choices:

- 1. Visual diagnostics: Operational status indication or diagnostics of the cause of fault
- Interface diagnostics: With the help of the OCI400 interface adapter and the ACS410 PC software or flue gas analyzers of different makes

Visual diagnostics:

In normal operation, the different operating states are indicated in the form of color codes according to the color code table given below.

Operational status indication

During startup, status indication takes place according to the following table:

| Color code table for | multicolor signal lamp (LED) | |
|---|--|-------------------|
| Status | Color code | Color |
| Waiting time «tw», other waiting states | 0 | Off |
| Ignition phase, ignition controlled | $\bullet \bigcirc \bullet \bigcirc \bullet \bigcirc \bullet \bigcirc \bullet \bigcirc \bullet \bigcirc \bullet \bigcirc \bullet$ | Flashing yellow |
| Operation, flame o.k. | | Green |
| Operation, flame not o.k. | | Flashing green |
| Extraneous light on burner startup | | Green-red |
| Undervoltage | | Yellow-red |
| Fault, alarm | ▲ | Red |
| Error code output (refer to «Error code | | Flashing red |
| table») | | - |
| Interface diagnostics | | Red flicker light |

Legend

Steady on

▲ Red

Yellow

□ Green

NNN

Operation, indication, diagnostics (cont'd)

Diagnostics of the cause of fault

After lockout, the red fault signal lamp LED will remain steady on. In that condition, visual diagnostics of the cause of fault according to the error code table can be activated by pressing the lockout reset button for more than 3 seconds. Pressing the reset button again for at least 3 seconds, interface diagnostics will be activated. Interface diagnostics works only if the AGK20... lockout reset button extension is not fitted. If, by accident, interface diagnostics has been activated, in which case the slightly red light of the signal lamp LED flickers, it can be deactivated by pressing again the lockout reset button for at least 3 seconds. The instant of switching over is indicated by a yellow light pulse.

During the time the cause of fault is diagnosed, the control outputs are deactivated Burner remains shut down

- External fault indication remains deactivated
- Fault status signal «AL» at terminal 10, according to the error code table

The diagnostics of the cause of fault is guit and the burner switched on again by resetting the burner control. Press the lockout reset button for about 1 second (< 3 seconds).
